

PyTorch Tutorial

05. Linear Regression with PyTorch

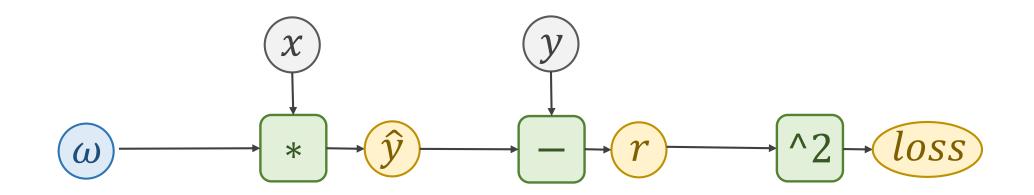

Revision

Linear Model

$$\hat{y} = x * \omega$$

Loss Function

$$loss = (\hat{y} - y)^2 = (x \cdot \omega - y)^2$$

```
print("predict (before training)", 4, forward(4).item())

for epoch in range(100):
    for x, y in zip(x_data, y_data):
        l = loss(x, y)
        l.backward()
        print('\tgrad:', x, y, w.grad.item())
        w.data = w.data - 0.01 * w.grad.data

        w.grad.data.zero_()

    print("progress:", epoch, l.item())

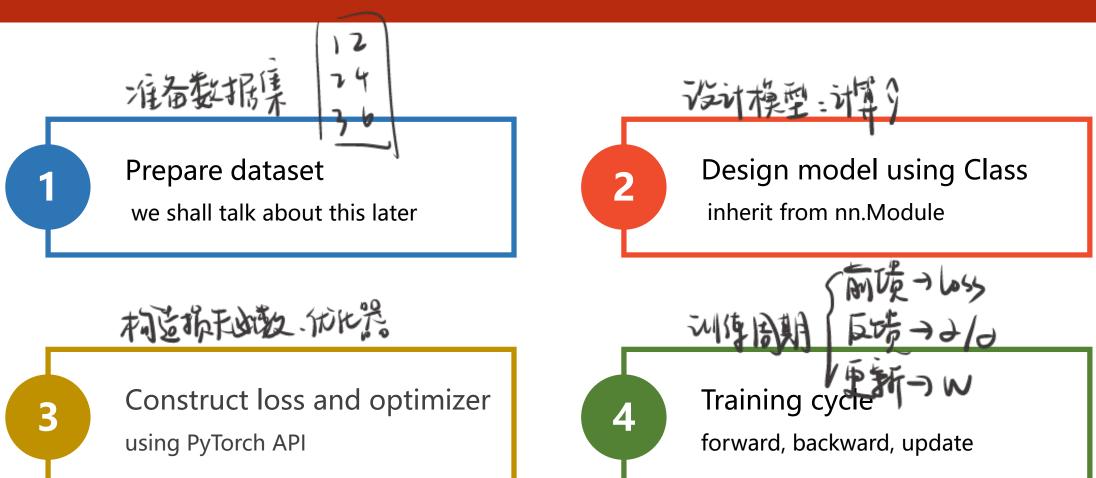

print("predict (after training)", 4, forward(4).item())
```

```

Lecturer : Hongpu Liu

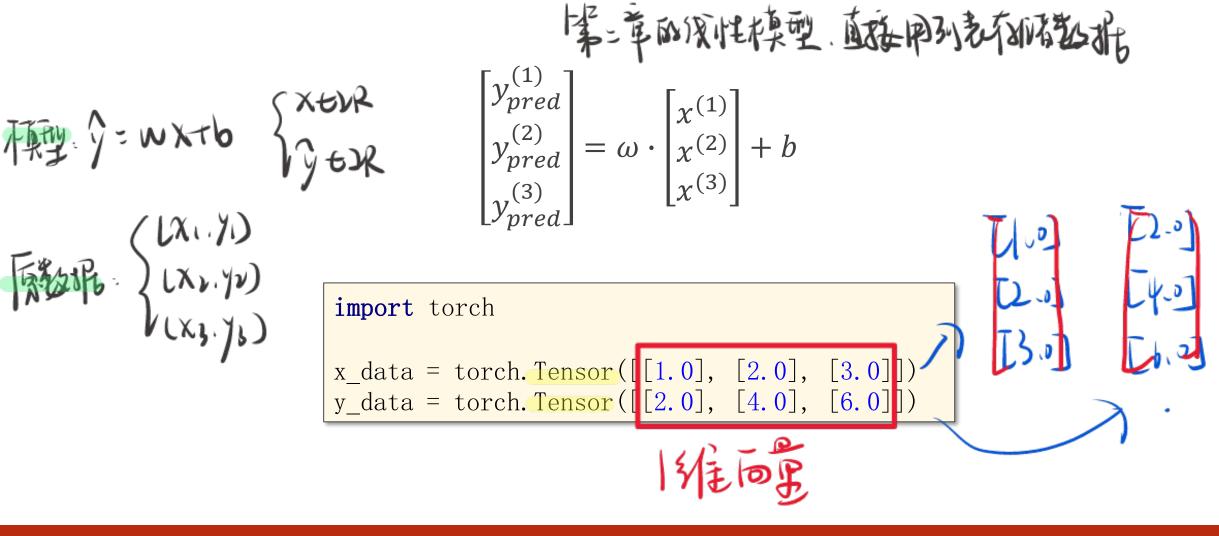

Lecture 5-3

PyTorch Fashion

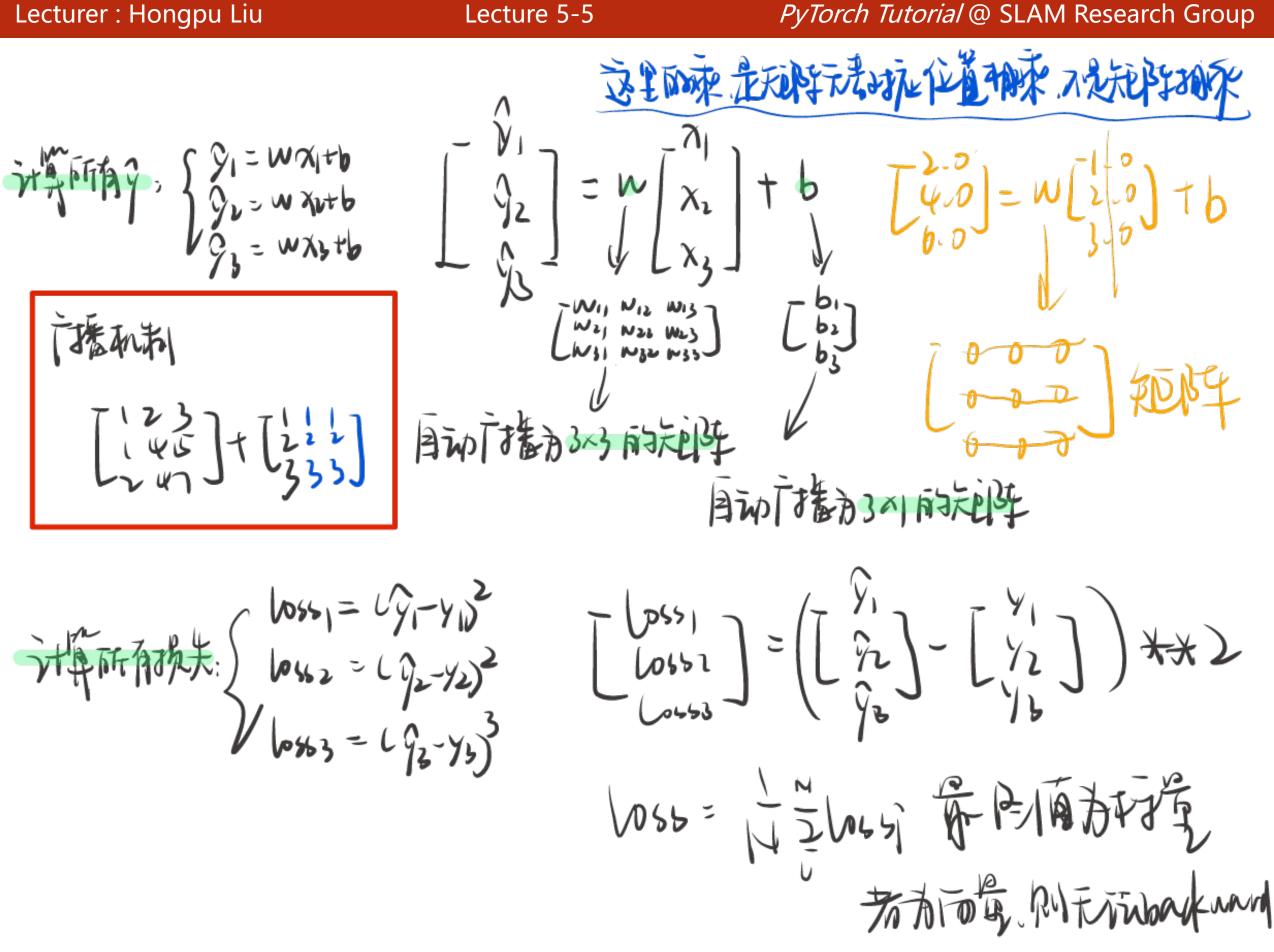

Linear Regression – 1. Prepare dataset

In PyTorch, the computational graph is in mini-batch fashion, so X and Y are 3×1 Tensors.

Lecture 5-5

Revision: Gradient Descent Algorithm

Derivative

$$\frac{\partial cost(\omega)}{\partial \omega} = \frac{\partial}{\partial \omega} \frac{1}{N} \sum_{n=1}^{N} (x_n \cdot \omega - y_n)^2$$

$$= \frac{1}{N} \sum_{n=1}^{N} \frac{\partial}{\partial \omega} (x_n \cdot \omega - y_n)^2$$

$$= \frac{1}{N} \sum_{n=1}^{N} 2 \cdot (x_n \cdot \omega - y_n) \frac{\partial (x_n \cdot \omega - y_n)}{\partial \omega}$$

$$= \frac{1}{N} \sum_{n=1}^{N} 2 \cdot x_n \cdot (x_n \cdot \omega - y_n)$$

Gradient

$$\frac{\partial cost}{\partial \omega}$$

Update

$$\omega = \omega - \alpha \frac{\partial cost}{\partial \omega}$$

Update

$$\omega = \omega - \alpha \frac{1}{N} \sum_{n=1}^{N} 2 \cdot x_n \cdot (x_n \cdot \omega - y_n)$$

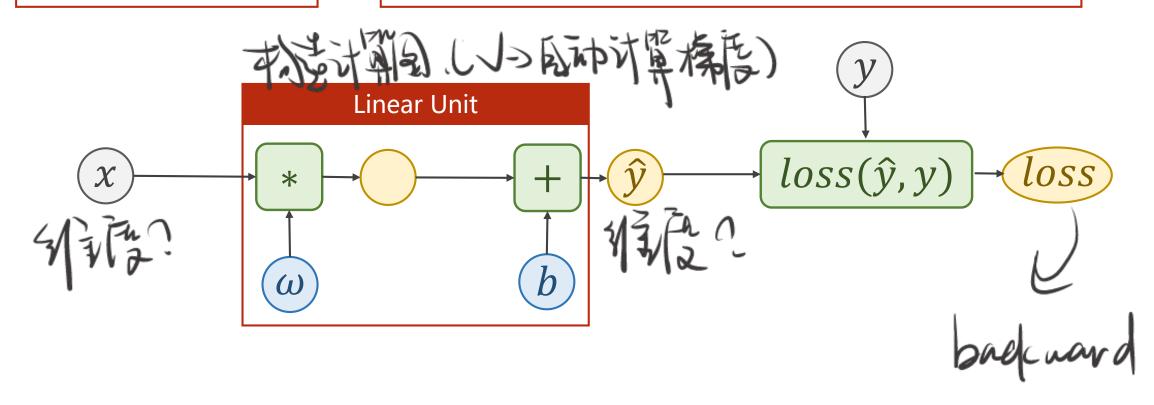

Lecturer : Hongpu Liu

Lecture 5-6

Affine Model $\hat{y} = x * \omega + b$

Loss Function

$$loss = (\hat{y} - y)^2 = (x \cdot \omega - y)^2$$

Lecturer : Hongpu Liu

Lecture 5-7

```
Our model class should be inherit

class LinearModel (torch. nn. Module):

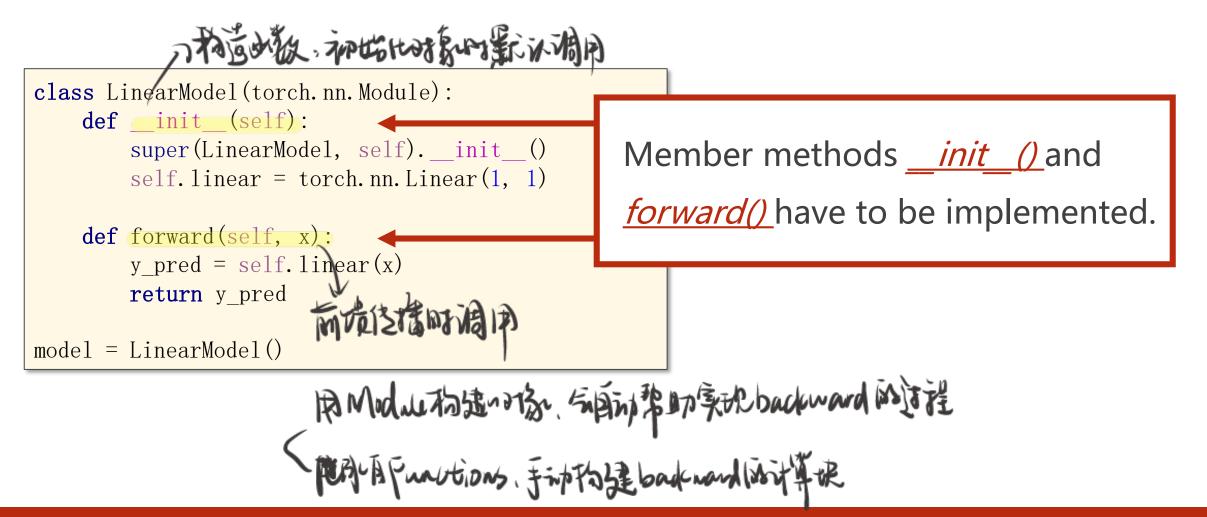

def __init__(self):
    super(LinearModel, self).__init__()
    self.linear = torch. nn. Linear(1, 1)

def forward(self, x):
    y_pred = self.linear(x)
    return y_pred

model = LinearModel()
```

Lecturer : Hongpu Liu

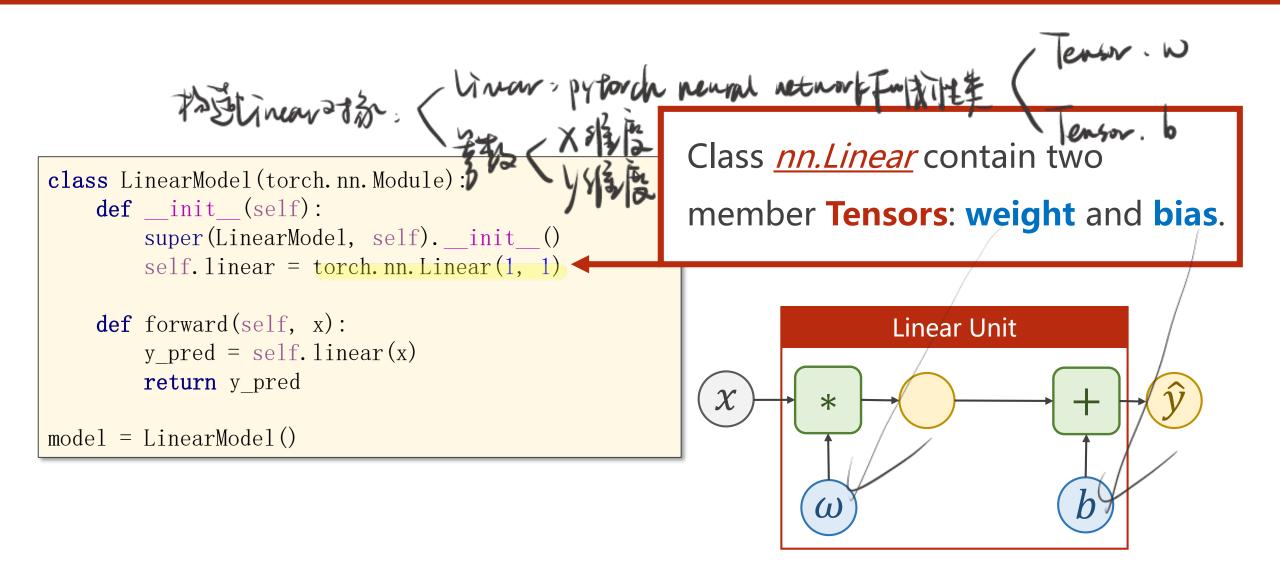

Lecture 5-8

Lecturer : Hongpu Liu Lecture 5-9

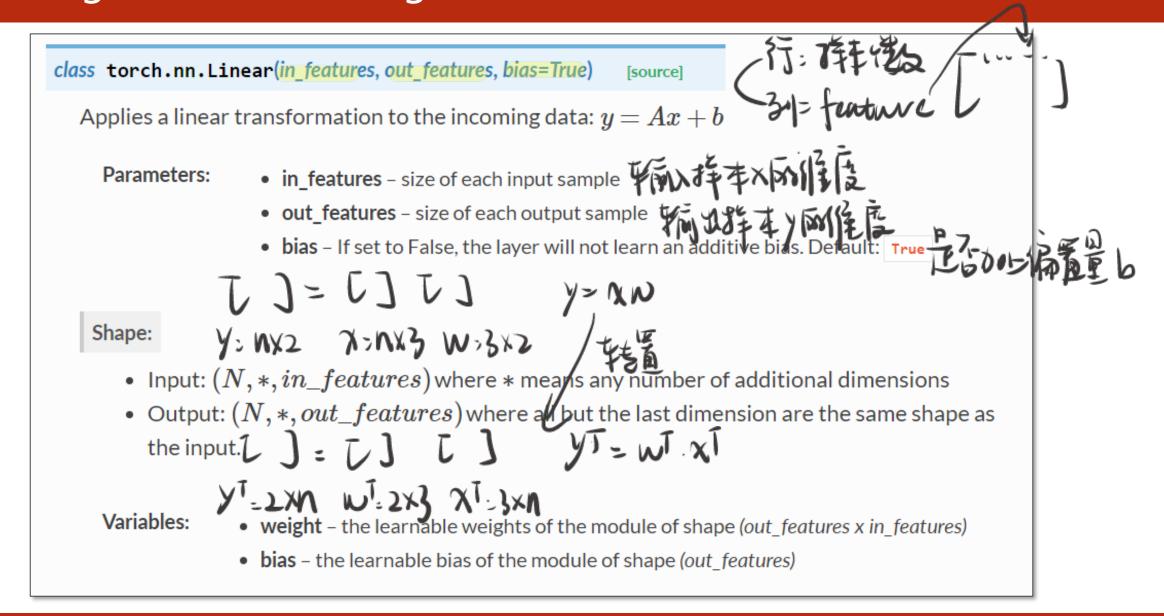

Lecturer : Hongpu Liu

Lecture 5-10

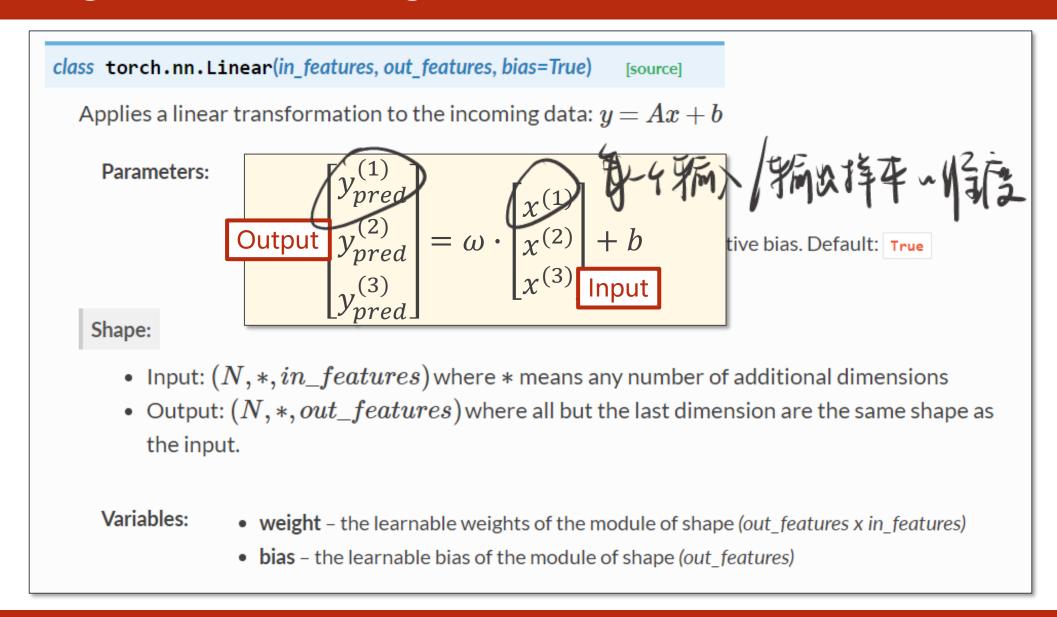

Lecturer : Hongpu Liu

Lecture 5-11

Lecturer : Hongpu Liu

Lecture 5-12

Lecturer : Hongpu Liu

Lecture 5-13

```
class LinearModel(torch.nn.Module):
   def __init__(self):
       super(LinearModel, self).__init__()
       self.linear = torch.nn.Linear(1, 1)
       y_pred = self.linear(x)
       return y_pred
model = LinearModel()
```

Class <u>nn.Linear</u> has implemented the magic method __call__(), which enable रिक्ति कार्टि देशिकामिकि the instance of the class can be called just like a function. Normally the forward() will be called.

Pythonic!!!

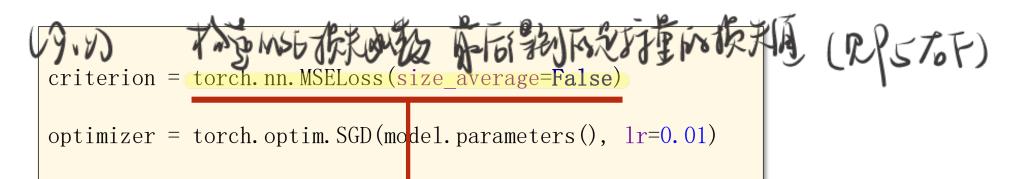

Lecturer : Hongpu Liu

Lecture 5-15

Linear Regression – 3. Construct Loss and Optimizer

class torch.nn.MSELoss(size_average=True, reduce=True) [source]

Creates a criterion that measures the mean squared error betwee target y.

Also inherit from **nn.Module**.

The loss can be described as:

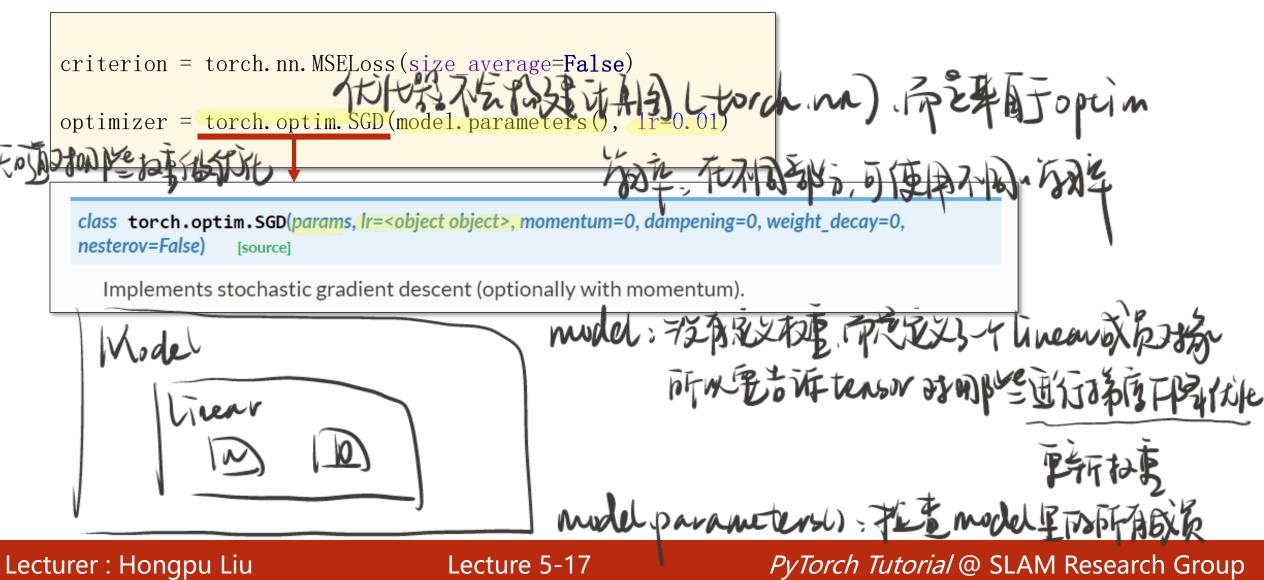

$$\ell(x,y) = L = \{l_1,\ldots,l_N\}^ op, \quad l_n = (x_n-y_n)^2,$$

where N is the batch size.

y_{test} = model(x_{test})
print('y_pred = ', y_test.data)
```

- Prepare dataset
 we shall talk about this later

 Design model using Class
 inherit from nn.Module

 Construct loss and optimizer
 using PyTorch API

 Training cycle
- forward, backward, update

Lecturer : Hongpu Liu

Lecture 5-25

Exercise 5-1: Try Different Optimizer in Linear Regression

- torch.optim.Adagrad
- torch.optim.Adam
- torch.optim.Adamax
- torch.optim.ASGD
- torch.optim.LBFGS
- torch.optim.RMSprop
- torch.optim.Rprop
- torch.optim.SGD

Exercise 5-2: Read more example from official tutorial
